

**Up until le mans 2023, the car had this variant.  
It only lived to see 4 IMSA races and 2 WEC races**

**The endurance lights only consists of 2x6 vertical led blocks.  
There are no horizontal endulights at this stage**

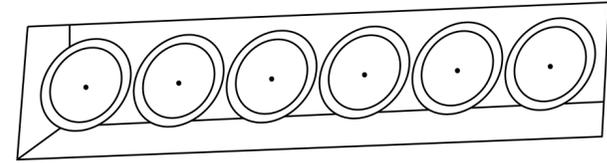

**This is the variant that debut with le mans 2023  
and still being used to this day**

**The lower endurance lights consists of 3x6 **horizontal** led blocks.  
Also horizontal endurance lights are introduced.  
Speaking of those... :)**

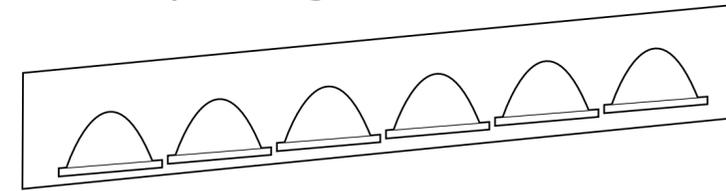

## WRONG DESIGN

Now, in ams2 and weirdly enough in LMU, the horizontal, thin endlights are wrongly modelled.

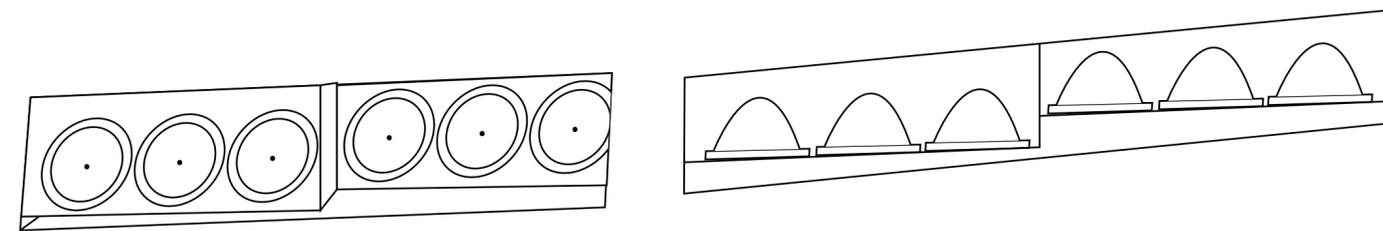

see how the led bulbs are just aligned perfectly straight?

S397, despite being the official dev of le mans, messed this up and is still going with that 3d model. I hope reiza can fix where they failed.

## This is the correct design:

As you can see, they can even individually turn on and off the 3 leds

**As a bonus, even the led bulbs used in the separate blocks are different. Notice how the inwards block is yellow and oldschool where as the outwards blocks is smaller and more silver? But it's very much okay if this detail is ignored.**

**Well, this is it, loving the 1.6 update and all i wish is my favorite car to reach absolute perfection.**

**Happy racing and thank you reiza!**
